1 Report

The project Monster Mash, while being largely enjoyable to work on, has undergone many changes since the beginning. This, together with the fact that the information flow from Bernie to various groups was less than ideal, has caused quite a bit of chaos, and forced us into rewriting most of the back-end code during a Tuesday afternoon and the week that followed.

1.1 Role in the Project

My task was to be in charge of version control (via using GitHub as our platform of choice) as well as writing up the HTML and CSS for the front-end of the application. I've volunteered for both tasks, mainly due to my previous work experience as a part of a small web developer group. The main task that I had to deal with was teaching my group mates the basics of using git and later on fixing up various mistakes or just maintaining some sort of order in the project repository.

2 General Conclusions

Work with my group members has been a pleasure, despite one of two moments when the pressure has gotten the better of me. Overall, given our circumstances and the amount of work that we have all put into the project, I feel that it was a very worthwhile activity and certainly a pleasant one, despite all the stress in the testing and implementation week. We've been lucky enough making sure that everyone worked at least a little and avoided any sort of a major crisis.
